Executive Summary

The Packham North study area (hereafter referred to as the "study area") is comprised of approximately 62ha of historically agricultural land situated within the City of Cockburn (CoC). The study area is bounded by a residential development to the south, Rockingham Road to the east, the railway line to the north and Cross Road to the west. The study area is currently zoned 'Rural' in the CoC's *Town Planning Scheme (TPS) No.3* (CoC 2002). The study area has been historically used for agriculture and stock agistment purposes. There are also some special use and light industry areas in the north and north-west. Therefore, much of the study area has historically been cleared.

Cardno has been engaged to develop a Sampling and Analysis Plan (SAP) to provide baseline groundwater quality and levels within the study area prior to development. The objective of collecting this data is to characterise the pre-development hydrological environment. The SAP captured groundwater levels and quality from October 2008 to March 2010. Physiochemical parameters were measured on a monthly basis over the monitoring period and nutrient and nutrient species were measured quarterly over the same period (i.e. 6 occasions).

The minimum surface to groundwater separation distance recorded was 2.05m at bore MW9, located centrally along the northern boundary of the study area. Through analysis of the groundwater depths of the ten installed bores it can be inferred that the study area has a moderate depth to groundwater in the central valley areas which increases to the east and west. The maximum groundwater levels (MGLs) recorded in 2008 were used to generate groundwater contours. These groundwater contours indicate that the ground water flow is in a westerly direction. The 2008 MGLs were used as 2008 was an above average rainfall year. Annual average maximum groundwater levels (AAMGLs) were unable to be generated as DoW bores within a 1.5km radius could not be referenced as they were either; not monitored over the same period, or within 150m of the coast and affected by sea levels.

Groundwater quality in relation to nutrient concentrations varied across the ten bores, with the southern portion of the study area generally displaying the highest concentrations. NO_X consistently recorded 'very high' readings. The spatial distribution of these readings suggest there is an inherently high level of NO_X in the vicinity of (and including) the study area, rather than a point source within the study area. NO_x comprises the oxides of nitrogen, nitrite (NO^2) and nitrate (NO^3). Elevated NO_x concentrations are potentially a concern as NO_x is known to have a correlation with accelerated algal growth, and because NO_2 is toxic to some aquatic species. TN and NO_X are the most significant nutrients and nutrient species as they recorded average concentrations up to and greater than ten times the ANZECC guideline values (2000). TN concentrations are at their highest in the south of the study area with the majority of these readings comprised of NO_X.

TP values were generally 'moderate' throughout the site. The TP concentration distribution mapping does not have a significant relationship with the direction of groundwater flow. Ortho P (the reactive form of phosphorous) was generally found in 'low' concentrations.

This report concludes the scope of work with regards to hydrological monitoring of the study area. As no inherent deficiencies have been identified, the monitoring parameters and methodology are considered to be adequate to have achieved the aims of the pre-development hydrological investigation. As such, Cardno is of the opinion that the current dataset is robust and comprehensive enough to assist in future planning of the proposed development.

1 Introduction

1.1 Project Background

The Packham North study area (hereafter referred to as the "study area") is comprised of approximately 62ha of historically agricultural land situated within the City of Cockburn (CoC). The locality of the study area is shown in **Figure 1**. The study area is bounded by a residential development to the south, Rockingham Road to the east, the railway line to the north and Cross Road to the west. These boundaries are shown in **Figure 2**. Cardno was engaged to develop a groundwater Sampling and Analysis Plan (SAP) to provide baseline water quality data and groundwater levels within the study area prior to development.

The study area is currently zoned 'Rural' in the CoC's *Town Planning Scheme (TPS) No.3* (CoC 2002). The historical use of the study area has been for market garden agriculture, pasture growth and stock agistment purposes. There are also some special use and light industry areas in the north and north-west. Therefore, much of the study area has historically been cleared.

The study area is proposed to be developed for residential purposes. Such a land use change can have implications for the types and quantity of pollutants released to local surface water and groundwater, which can in turn affect the ecological health of downstream receiving environments.

1.2 Monitoring Objective

Cardno has been engaged to gather baseline data within the study area prior to development. The objective of collecting this data is to characterise the pre-development hydrological environment of the study area. To achieve this objective, Cardno developed the SAP detailed in the following sections of this report. It was determined that in order to achieve the project objective, the SAP would need to:

- Identify and quantify nutrient hotspots so that appropriate management measures can be implemented to avoid exacerbating the current situation;
- Determine groundwater quality to provide baseline data against which the effectiveness of future urban stormwater management and development impacts can be compared; and
- Understand the groundwater levels within the study area to determine if fill is required to achieve satisfactory separation distance.

Baseline data will be used to inform the future design process and will ensure that any future development is able to fulfil the stormwater management requirements of the Department of Water (DoW).

1.3 Purpose of this Report

This report documents the results of the groundwater quality and groundwater levels monitoring that was undertaken between October 2008 and March 2010.

2 Sampling and Analysis Plan Rationale

2.1 Key Documents and Inputs

There are a number of published guidelines and standards available which provide direction regarding the discharge characteristics that residential development should aim to achieve. These were key inputs utilised for development of the SAP, and include:

- *National Water Quality Management Strategy* (ANZECC 2000).
- *Stormwater Management Manual for Western Australia* (DOW 2007).
- *Development of Sampling and Analysis Programs* (DOE 2001).
- *Better Urban Water Management* (WAPC 2008).

The guidance documents detailed above were reviewed to determine the likely data requirements for the study area. These documents point to the need for accurate baseline data prior to development. Additionally, existing groundwater levels have potential implications for the stormwater management measures and the extent of earthworks/ fill that will be required to facilitate development.

2.2 Groundwater Methodology

Ten shallow groundwater bores were installed within the study site at locations which would provide the best representation of anticipated shallow/ perched groundwater systems. These locations will allow for the identification of nutrient hotspots and development of underlying groundwater contours. The locations of these groundwater bores are shown in **Figure 2**.

The groundwater bores were constructed of 50mm threaded PVC slotted screen and blank casing sections. A 3m screened section was installed in each of the bores to approximately bisect the observed groundwater level. Graded gravel pack was placed around the screened section extending at least 0.5m above the top of the screened section. A bentonite seal was placed above the gravel pack and the bore annulus was backfilled with any available cuttings and concrete to the surface. Each bore was completed with approximately 0.5m of PVC casing extending above the ground surface and a protective steel casing. All bores were logged for hydro-geological parameters on installation. Bore completion log sheets are contained in **Appendix A.**

2.2.1 Groundwater Levels

Groundwater levels were measured on a monthly basis for 18 months on all installed bores. The bores were measured using an audible dip meter to record standing water levels. All bores have been surveyed to provide an accurate elevation, thereby allowing accurate calculation of groundwater contours.

2.2.2 Groundwater Quality

A clear understanding of the existing groundwater quality is important to determine whether the quality of water in the superficial aquifer is slowly improving with time or at least not degrading as a result of development. Groundwater quality sampling for physiochemical parameters was conducted

on a monthly basis for a period of 18 months following installation of the monitoring bores. Groundwater quality sampling for nutrient concentrations was conducted on a quarterly basis over the same period (i.e. 6 occasions).

Bores were purged using an electric pump prior to sampling. A Hydrolab Quanta water quality meter was used to collect field chemical data. Purging of the well was continued for approximately five minutes before samples were collected for *in situ* physiochemical and laboratory analysis. Physiochemical parameters measured *in situ* include:

- pH.
- Temperature.
- Salinity.
- Electrical Conductivity (EC).
- Oxidation-Reduction Potential (Eh).

Upon collection, groundwater samples are placed directly into laboratory prepared and supplied containers. The samples are then placed on ice immediately following collection and transported to the laboratory under standard Chain of Custody procedures. Samples are submitted to a National Association of Testing Authority (NATA) accredited laboratory for analysis. The parameters selected for groundwater analysis include:

- Total Nitrogen (TN).
- Total Phosphorous (TP).
- Ortho-Phosphorous (Ortho P).
- Oxides of Nitrogen (NO_x).
- Total Kjeldahl Nitrogen (TKN).
- Ammonium (NH_4).

2.2.2.1 Chain of Custody

Standard Chain of Custody forms are completed for all samples transferred to the laboratory, detailing the sample identification, collection date and the requested analysis. Upon receipt of the samples the laboratory completes the Chain of Custody forms and provides a copy to Cardno for confirmation. Completed Chain of Custody forms for sampling undertaken are provided in **Appendix B.**

2.2.2.2 Laboratory Analysis

All laboratory analysis was conducted by a NATA accredited laboratory with all primary and QA/QC samples submitted to a NATA accredited laboratory for analysis. Laboratory certificates of analysis are included in **Appendix B**.

3 Assessment Criteria

In order to provide an indication of the relative concentration of nutrient levels and physiochemical parameters within groundwater, comparison with the 'default trigger values for slightly disturbed ecosystems (lowland river) in South Western Australia' (ANZECC 2000) is made in the following sections. While the default trigger values are applicable to nutrient concentrations within surface water features, they are not specifically intended for application to groundwater nutrient concentrations. However, as there are no nationally published trigger values available for groundwater quality, a comparison of nutrient concentrations and some physiochemical parameters are made to the 'default trigger values' to provide some context to the measured concentrations. As such, the 'default trigger values' are hereafter referred to as the 'guideline values'. These guideline values are shown in **Table 3.1**.

Table 3.1 ANZECC Guideline Values

TN (µg/L)	TP (µg/L)	Ortho P (µg/L)	NH_4 (µg/L)	NO_X (µg/L)	DO (%)	pH	Salinity (µS/cm)
1,200	65	40	80	150	80-120	6.5-8.0	120-300

Discussion of nutrient concentrations in the following sections refers to their relative concentration compared to the guideline values. The terms 'low', 'moderate', high' and 'very high' are used in the following manner:

- 'Low' – nutrient concentration below, equal to or marginally above default trigger value;
- 'Moderate' – nutrient concentration up to five times the default trigger value;
- 'High' – nutrient concentration between five and 10 times the default trigger value; and
- 'Very High' – nutrient concentrations more than 10 times the default trigger value.

Principally, comparison is made for the TN and TP concentrations. However, some comment is also provided for nutrient species (Ortho P, NH_4, NO_X) where these form a substantial portion of the overall nutrient concentrations.

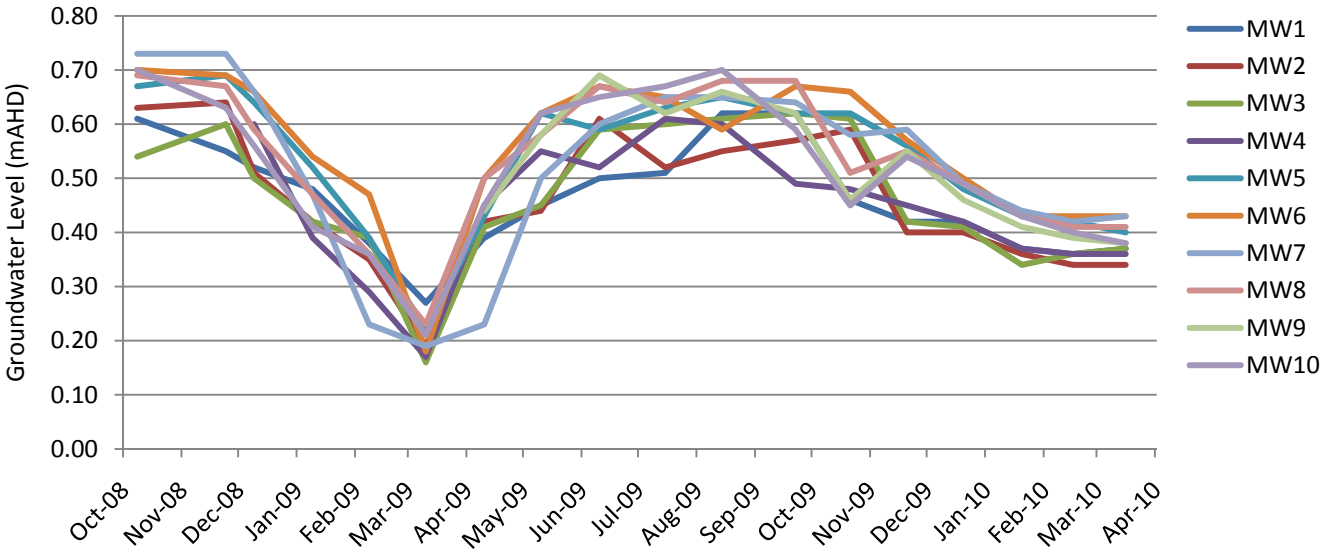
4 Monitoring Results

4.1 Groundwater Levels

The groundwater levels, and survey data for each bore are shown in **Appendix C**. Depth to groundwater for the ten bores was measured monthly from October 2009 to March 2010. The depth to groundwater ranged from 2.05mBGS (Bore MW9, June 2009) to 14.28mBGS (Bore MW3, March 2009).

Analysis of DoW groundwater bore level data across Perth and in a 10km radius of the study area indicate that groundwater levels are typically at their lowest in March/ April and at their highest in October, with seasonal fluctuations of up to approximately 2m. **Figure 4.1**

Figure 4.1 Groundwater Hydrograph



As shown in **Figure 4.1**, maximum groundwater levels were generally observed in October 2008 while the minimum groundwater levels were recorded in March 2009. **Table 4.1** shows the maximum groundwater levels observed during each year monitoring occurred.

Table 4.1 Maximum Groundwater Levels

Groundwater Bore	Maximum Groundwater Level (mAHD)	
	2008	2009
MW1	0.61	0.62
MW2	0.64	0.61
MW3	0.60	0.62
MW4	0.60	0.61
MW5	0.69	0.65
MW6	0.70	0.67
MW7	0.73	0.65
MW8	0.69	0.68
MW9	-	0.66
MW10	0.70	0.70

The maximum groundwater levels (MGLs) recorded in 2008, shown in **Table 4.1**, were used to generate the groundwater contours shown in **Figure 2**. The 2008 MGLs were used as 2008 was and above average rainfall year. Annual average maximum groundwater levels (AAMGLs) were unable to be generated as DoW bores within a 1.5km radius could not be referenced as they were either; not monitored over the same period, or within 150m of the coast and would be influenced by sea levels. Analysis of the groundwater contours shown in **Figure 2** indicate that the ground water flow is in a westerly direction.

4.2 Groundwater Quality

Groundwater quality monitoring was conducted between October 2009 and March 2010. Physiochemical parameters were measured *in situ* on a monthly basis (except for November 2009, when samples were not taken due to equipment failure) while nutrients and nutrient species were measured on a quarterly basis by a NATA accredited laboratory. A summary of the average results are shown in **Table 4.2.1**. The complete analysis of results is shown in **Appendix D**.

Table 4.2.1 Summary of Groundwater *in situ* and Laboratory Analysis Results

	Trigger Values	MW1	MW2	MW3	MW4	MW5	MW6	MW7	MW8	MW9	MW10

NO_2+NO_3 (µg/L)	150	3,675 (539)	2,060 (333)	9,800 (1,142)	11,733 (1,537)	7,960 (912)	16,050 (6,108)	3,160 (1,129)	3,837 (2,132)	2,442 (4,574)	11,300 (992)
TKN (µg/L)	-	417 (172)	200 (63.2)	480 (295)	733 (665)	350 (176)	2,150 (2,192)	333 (121)	267 (121)	475 (289)	483 (366)

Note: the above statistics are 'average'/'standard deviation'. Trigger values are for Lowland Rivers in South Western Australia, as classified by ANZECC (2000).

As shown in **Table 4.2.1**, comparison of the physiochemical parameters and nutrient concentrations with the ANZECC guideline values indicates:

- 'Moderate' to 'Very High' TN concentrations;
- 'Low' to 'Moderate' TP concentrations;
- 'Low' Ortho P and NH_4 concentrations;
- 'Very high' NO_X concentrations;
- Salinity values that exceed the guideline range at all monitoring locations;
- pH values within the guideline range; and
- DO readings within or below the guideline range.

The spatial mapping of the average TN and TP concentrations are shown in **Figures 3** and **4** respectively. The TN distribution mapping shows 'very high' concentrations centred near Bore MW6 and MW4. The TN distribution mapping shows groundwater in the northern portion contains significantly lower TN concentrations than the southern portion of the study area. As shown in **Table 4.2.1**, the majority of the TN concentrations are comprised of very high concentrations of the nitrous oxides (NO_2 and NO_3) across the entire study area. Analysis of the raw data shown in **Appendix D**

indicates that the majority of the low concentrations of TN and NO_X were recorded in July whereas the high concentrations were primarily recorded in October and January.

The TP concentrations are significantly lower than the TN and NO_X concentrations. TP distribution mapping shows localised 'moderate' concentrations around bores MW3, MW6 and MW10, however the TP mapping does not show a significant relationship with the direction of groundwater flow.

5 Discussion

The SAP was able to capture groundwater levels and quality from October 2008 to March 2010. Physiochemical parameters were measured on a monthly basis over the monitoring period (except for November 2009, when physiochemical parameters were unable to sampled due to equipment failure) and nutrient and nutrient species were measured quarterly over the same period (i.e. 6 occasions).

Groundwater contours were generated from the 2008 MGLs and indicate a westerly groundwater flow. The minimum surface to groundwater separation distance recorded was 2.05m at bore MW9, located centrally along the northern boundary of the study area. Through analysis of the groundwater depths of the ten installed bores it can be concluded that the study area has a moderate depth to groundwater in the valley areas where the bores are installed. No suitable DoW reference bore is located within a 1.5km radius of the study area. For this reason AAMGLs have not been calculated for the study area. The close proximity to sea level (approximately 0mAHD) provides some context to the MGLs recorded.

Groundwater quality in relation to nutrient concentrations varied across the ten bores, with the southern portion of the study area generally displaying the highest concentrations. NO_X consistently recorded 'very high' readings. The spatial distribution of these readings suggest there is an inherently high level of NO_X in the vicinity of (and including) the study area, rather than a point source within the study area. NO_x comprises the oxides of nitrogen, nitrite (NO^2) and nitrate (NO^3). Elevated NO_x concentrations are potentially a concern as NO_x is known to have a correlation with accelerated algal growth, and because NO_2 is toxic to some aquatic species. TN and NO_X are the most significant nutrients and nutrient species as they recorded average concentrations up to and greater than ten times the ANZECC guideline values (2000). TN concentrations are at their highest in the south of the study area with the majority of these readings comprised of NO_X.

TP values were generally 'moderate' throughout the site. The TP concentration distribution mapping does not have a significant relationship with the direction of groundwater flow. Ortho P (the reactive form of phosphorous) was generally found in 'low' concentrations.

6 Conclusion

This report concludes the scope of work with regards to hydrological monitoring of the study area. As no inherent deficiencies have been identified, the monitoring parameters and methodology are considered to be adequate to have achieved the aims of the pre-development hydrological investigation. As such, Cardno is of the opinion that the current dataset is robust and comprehensive enough to assist in future planning of the proposed development.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

NATA Accredited Laboratory 825

This document is issued in accordance with NATA accreditation requirements.

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Perth Inorganics

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insuffient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When date(s) and/or time(s) are shown bracketed, these have been assumed by the laboratory for processing purposes. If the sampling time is displayed as 0:00 the information was not provided by client.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **LOR raised for TKN/TP due to sample matrix**

TPH (C6-C36) [19]	EP080/ EP071	USEPA 5030/8260 USEPA 3510/8015 P&T-GC/MS/FID	20-100 µg/L	49.00
OC/OP Pesticides	**W-12**	GC/ECD/FPD-MS	0.5-2 µg/L	65.00
TOTAL SUITE COST FOR WATER SAMPLES:				**266.00**

Please note: *to receive analysis at the above cost, the ALS quotation number must be referenced on the COC.*

Where metals suites are stipulated '**T**' denotes Total metals analysis (eg. W-2 T = 8 Total Metals). Where no '**T**' is present in the suite code, this denotes dissolved/filtered metals.

For metals in waters, field filtration status must be clearly indicated on the bottle label (via tick) indicating whether total or dissolved metals are required.

Package Prices apply only when specific ALS Group Codes ('W' & 'NT' suites) are selected on COCs. Standard LORs apply for suites.

Administration Charges

An administration fee of $30.00 is applicable to each submission of samples submitted regardless of the size of the submission.

Water Container Codes: P = Unpreserved Plastic; N = Nitric Preserved Plastic; ORC = Nitric Preserved ORC; SH = Sodium Hydroxide/Cd Preserved; S = Sodium Hydroxide Preserved Plastic; AG = Amber Glass Unpreserved; V = VOA Vial HCl Preserved; VS = VOA Vial Sulphuric Preserved; SG = Sulfuric Preserved Amber Glass; H = HCl preserved Plastic; HS = HCl preserved Speciation bottle; SP = Sulfuric Preserved Plastic; F = Formaldehyde Preserved Glass; Z = Zinc Acetate Preserved Bottle; E = EDTA Preserved Bottles; ST = Sterile Bottle; ASS = Plastic Bag for Acid Sulphate Soils; B = Unpreserved Bag.

ALS LABORATORY GROUP

Analytical Charges

Suite 1

Parameter	ALS Method/ Package Code	Technique/ Method Reference	Limit of Reporting (mg/L) (or as indicated)	Price per Sample ($)
Nitrogen - Ammonia as N	EK055G	APHA 4500-NH_3 H	0.01	20.00
Total Nitrogen *(incl TKN + NO_x)* + Total Phosphorus	**NT-11**	EK062, EK061, EK057, EK058, EK067	0.01 (TN, TKN - 0.1)	50.00
Phosphorus – Reactive	EK071G	APHA 4500-P G	0.01	12.00
TOTAL SUITE COST FOR WATER SAMPLES:				**82.00**

Please note: *to receive analysis at the above cost, the ALS quotation number must be referenced on the COC.*

Suite 2

Parameter	ALS Method/ Package Code	Technique/ Method Reference	Limit of Reporting (mg/L) (or as indicated)	Price per Sample ($)
Nitrogen - Ammonia as N	EK055G	APHA 4500-NH_3 H	0.01	20.00
Total Nitrogen *(incl TKN + NO_x)* + Total Phosphorus	**NT-11**	EK062, EK061, EK057, EK058, EK067	0.01 (TN, TKN - 0.1)	50.00
Phosphorus – Reactive	EK071G	APHA 4500-P G	0.01	12.00
Dissolved Metals by ICPMS – As, Cd, Cr, Cu, Pb, Ni, Zn, Al, Fe	EG020F	USEPA 6020 ICPMS	0.0001 - 0.01	22.00
Total Recoverable Metals by ICPMS (incl digest) – As, Cd, Cr, Cu, Pb, Ni, Zn, Al, Fe	EG020T	USEPA 6020 ICPMS	0.0001 - 0.01	28.00
Mercury – **Dissolved**	EG035F	APHA 3112 Hg-B CV/FIMS	0.0001	10.00
Mercury - **Total Recoverable**	EG035T	APHA 3112 Hg-B CV/FIMS	0.0001	10.00
TPH (C6-C36) [19]	EP080/ EP071	USEPA 5030/8260 USEPA 3510/8015 P&T-GC/MS/FID	20-100 µg/L	49.00
OC/OP Pesticides	**W-12**	GC/ECD/FPD-MS	0.5-2 µg/L	65.00
TOTAL SUITE COST FOR WATER SAMPLES:				**266.00**

Please note: *to receive analysis at the above cost, the ALS quotation number must be referenced on the COC.*

Where metals suites are stipulated '**T**' denotes Total metals analysis (eg. W-2 T = 8 Total Metals). Where no '**T**' is present in the suite code, this denotes dissolved/filtered metals.

For metals in waters, field filtration status must be clearly indicated on the bottle label (via tick) indicating whether total or dissolved metals are required.

Package Prices apply only when specific ALS Group Codes ('W' & 'NT' suites) are selected on COCs. Standard LORs apply for suites.

Administration Charges

An administration fee of $30.00 is applicable to each submission of samples submitted regardless of the size of the submission.
